

INCIDENT MANAGEMENT CD – IMCD™

IMCD™ is the software solution that completely automates the disaster recovery planning process for small to mid-sized businesses and for business units and vendors of larger companies.

Guided and Interactive

IMCD™, which stands for Incident Management CD™, explains Incident Management and Disaster Recovery Planning to the user and then guides the user interactively through a series of questions and answers to a complete disaster recovery solution, including both ongoing and emergency operating procedures.

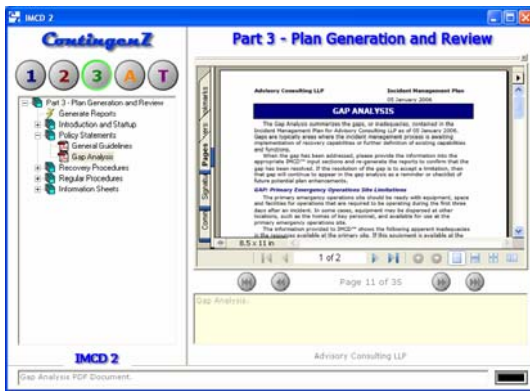

Unique Gap Analysis

Most impressively, the program also produces a dynamic Gap analysis that details the steps the business needs to take to achieve a good recovery posture.

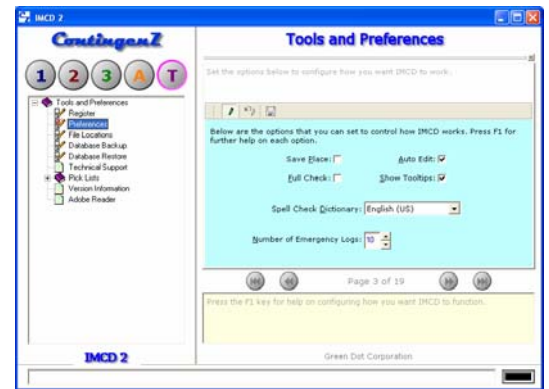

Comprehensive and affordable protection

This is the first program of its kind and is a complete solution for small to mid-sized businesses and for business units and vendors of large businesses. IMCD™ educates the user, asks the questions, does the analysis and produces the procedures that protect a business in case of a disaster or cyber attack.

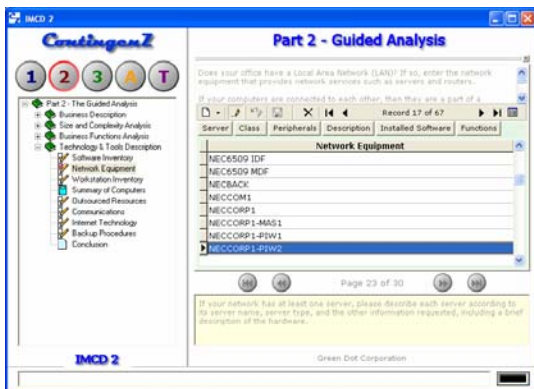

Technical Summary

IMCD™ is the only software available today that incorporates the industry standard *Generalized Cost Containment Model*, which is a streamlined analytic method for developing contingency plans based on potential impacts of outages. The software guides a novice user through a series of simple screens to collect information and perform impact analyses. Human issues, business issues and technology issues are all mapped to identified and prioritized business functions so that resources required during emergencies are quickly and easily found and activated.

Full Document Control Center

IMCD is a full document control center for continuity, recovery and related documents. Incorporate existing documentation, including business processes, maps, mission statements, Sarbanes-Oxley compliance controls, HIPAA procedures and others, directly into IMCD. Changes to other documents are automatically incorporated into IMCD.
